

## Part 1)

### Project goals:

Web server (examples: Shopping Website, Social Media Website, Game website)

### Platform choice:

Virtual Machine Debian

### Requirements:

Since we do not know what type of web server we would make, we would provide some examples of how we are going to do it depending on what we picked.

- 1) We will look up some YouTube tutorials on how to set up multiple accounts for a website. Then we will try to implement the accounts system.
- 2) We will look up some YouTube tutorials on how to do corresponding services based on the type of web server that we will make.
- 3) We will look up some YouTube tutorials on how to create a basic security system and integrate it into our web server and change it according to our web server.
- 4) We will think of stuff that needs to be automated and use YouTube to get some tips on how to automate said service.

### Major technical solutions compared:

We still do not know what we are aiming to compare.

### Timeline:

Week 12 – Team Project Proposal

Week 13 – Work on the Project and write journals

Week 14 – Work on the Project to try to finish it and write more journals

Week 15 – Prepare for Oral Presentation

### Team composition:

Alihan Djamankulov, Craig Justin Balibalos, Steven Facchino
